In this paper we build a comprehensive and validated geographic panel database based on all available geographic information in SHARE data up to wave 9. We use geographic information from sampling, from the baseline interview, from regular wave interviews, from special surveys, and from the life history interview. In the resulting Housing Episodes Panel Database, we consolidate all geographic information in SHARE into the official NUTS level 0-3 territorial unit classification of 2003, 2006, 2010, 2013, 2016, and 2021, respectively, for each respondent and year from birth to the last interview. The Household Episodes Panel data can be combined with other SHARE data, including the Job Episodes Panel Dataset, as well as linked to external administrative, Eurostat, environmental or other data.

1 NUTS Classifications in SHARE Data

Information coding in SHARE follows the Eurostat Nomenclature of Statistical Territorial Units (NUTS) [1]. The specific geographic information coding, however, differs depending on the wave and scope of the information collected.

NUTS classification has varied over time and SHARE has followed the changes introduced by Eurostat during its sampling for new (baseline) respondents. As a result, the NUTS classification used in sampling is the following:

1. In waves 1-2, NUTS were classified according to the 2003 Eurostat Classification.
2. In waves 4-5, NUTS were classified according to the 2010 Eurostat Classification.
3. In waves 6-7, NUTS were classified according to the 2013 Eurostat Classification.
4. In waves 8-9, NUTS were classified according to the 2016 Eurostat Classification.
5. The life history interviews in waves 3 and 7 were later released in the NUTS 2013 Eurostat Classification.

There was no sampling in wave 3 and in the two COVID-19 special surveys in wave 8ca and 9ca, since only panel respondents were interviewed. Although the general rule dictated the use of the most recent NUTS classification at the time of sampling for each wave, there were some exceptions:

1. In DE, the sampling classification in waves 5 and 6 adhered to the NUTS 2006 classification.

‡Dipartimento di Economia, Università Ca' Foscari, Venice, Italy.

¹The description of NUTS classification is available at the specific Eurostat webpage <https://ec.europa.eu/eurostat/web/nuts/overview>.

2. In GR, during wave 6, the country code GR in the 2006 classification was updated to EL in the 2010 NUTS classification.
3. In IT, the sampling classification in waves 4 and 5 followed the NUTS 2006 classification.
4. In SE, the sampling classification in wave 4 was based on the NUTS 2003 classification.
5. In SI, the sampling classification in waves 6 and 7 utilized the NUTS 2016 classification.
6. In CH, the NUTS 2021 classification was employed across all waves.
7. Minor inconsistencies in sampling classification were rectified in CZ, DE, FR, GR, HU, IT, LT, PL, SE, and SI.

1.1 Sampling Data

Sampling procedures vary across countries and waves, influenced by specific national legislation and the practices of survey agencies during fieldwork. Countries employ diverse sampling methods: some utilize official registers containing precise addresses of eligible populations, while others employ sampling from randomly selected street addresses. It is important to note that sampling information may not always align with the actual housing location of respondents at the time of baseline interview. Therefore, it is valuable to complement sampling geographic information with interview location data.

In 2023, SHARE provided sampling information detailing how respondents were recruited to participate in the survey. Additionally, survey agencies were requested to provide information on interview location available for all previous waves. However, due to agency turnover and data management issues in some countries, geographic data from distant waves may have been lost. As a result, even imperfect sampling information can offer insights, sometimes being more accurate than reported baseline or wave interview locations.

1.2 Baseline Data

Up to Release 7.1.0, SHARE data contained NUTS information for each respondent at the time of his or her first baseline interview. The NUTS level 0 (country code) is the minimal geographic information for each completed interview. In later releases, SHARE data contain NUTS information for each respondent at level 1.

1.3 Interview Data

The survey agencies provided geographic information pertaining to interview locations in 2023, utilizing the latest NUTS 2021 classification. However, in many countries, data for one or more waves is unavailable due to changes in survey agencies or the lack of retention of such information over time.

1.4 Life History Data

In retrospective life-history interviews (waves 3 and 7) respondents provided information on the region of each consecutive residence in their housing history, including the current residence. This data were available to users in the official open-access SHARE Release 7.1.0 in the 2013 Eurostat Classification.

The starting year of each housing episode $n = 1, \dots, N$ where $N = 28$ is recorded in variable `s1_ac006.n` in life history in wave 3 and `ra006.n` in wave 7, respectively. The region of residence is

coded for each housing episode in `sl_ac015c_n` and `ra015c_n`, respectively. The end year of each residence is recorded in `sl_ac021_n` or `ra021_n`, respectively, with the current housing identified as 9997 (still living in the residence).

Unfortunately, the list of regions often did not correspond to an official NUTS classification. Respondents were provided with showcards with a list of historical and/or current regions that country teams deemed the most appropriate for classifying historical and current regions over time.² Some countries used purely geographical regions, some used historical regions, other countries provided a list of current NUTS regions at different levels of granularity. At the end, most of the life history geographic regions can be linked to a NUTS 2 level classification. In several countries (Cyprus, the Czech Republic, Finland, Croatia, the Baltic countries, Slovenia and Slovakia) the regions can be matched to valid NUTS level 3 codes.

1.5 Classification changes over time

The official Eurostat NUTS units underwent significant changes over time in most countries. Notably, in BG, DK, DE, GR (EL), PL, FI, and particularly France, the changes were substantial, especially between the 2003, 2006, and 2010 classifications, in which waves 1 to 5 were coded. However, since 2013, the official NUTS classification has remained relatively stable. For detailed insights into the historical evolution of NUTS classification, including correspondence tables and changes over time utilized in constructing this database, we refer to the Eurostat website.³

1.6 Classification in Switzerland and Israel

In Switzerland, the NUTS 2021 classification was consistently utilized across all waves. For Israel, which falls outside the Eurostat classification system, regional data were initially encoded into five NUTS 1 regions (IL1 Jerusalem, IL2 North, IL3 Haifa, IL4 Center, IL5 Tel-Aviv). Two more NUTS 1 regions were introduced in wave 7 (IL6 South and IL7 Judea and Samaria).

2 geoSHARE Household Episodes Panel Variables

For each NUTS Classification, data from sampling, baseline and regular wave, life-history, and special surveys interviews are merged into a geoSHARE Household Episodes Panel dataset. All variables are shown in Table [1](#).

2.1 Respondent and Household Identifiers

For each respondent, identified by `mergeid`, all observations are coded for each year of his or her life from birth to the last available interview. `hhid` denotes the household the respondent belongs to at the time of an interview. In each household, one respondent was designated as a household respondent, `r_hh`, and a family respondent, `r_fam`. `cname` is the official abbreviation of the country name for the respective classification.

²The life history questionnaire in SHARE was based on the same questionnaire in the English Longitudinal Study of Ageing with a list of generic geographic regions North East, North West, Yorkshire and the Humber, East Midlands, West Midlands, East, London, South East, South West.

³See <https://ec.europa.eu/eurostat/web/nuts/history>.

Table 1: geoSHARE Variables

Variable name	Description	Value
Identifiers:		
<code>mergeid</code>	respondent id	<code>zz-nnnnnnn-nn</code>
<code>hhid</code>	household id	<code>zz-nnnnnnn-n</code>
<code>cname</code>	country name	<code>zz</code>
<code>r_hh, r_fam</code>	respondent for household, family	0/1
Waves and interviews:		
<code>wave</code>	wave number of interview	<code>n/8ca/9ca</code>
<code>wave_lh</code>	wave number of life history interview	<code>n</code>
<code>int_year</code>	year of interview	<code>nnnn</code>
<code>int_month</code>	month of interview	<code>n</code>
Years and Residences:		
<code>year_birth</code>	year of birth	<code>nnnn</code>
<code>year_l</code>	year of last interview	<code>nnnn</code>
<code>year</code>	year between <code>year_birth</code> and <code>year_l</code>	<code>nnnn</code>
<code>year_f</code>	year of first geographic observation	<code>nnnn</code>
<code>year_b</code>	year of baseline interview	<code>nnnn</code>
<code>year_lh</code>	year of life history interview	<code>nnnn</code>
<code>house_lh</code>	number of a life history episode	<code>n</code>
<code>year_start</code>	starting year of a housing episode in life history	<code>nnnn</code>
<code>year_end</code>	ending year of a housing episode in life history	<code>nnnn</code>
<code>year_start_cr</code>	starting year of the current residence	<code>nnnn</code>
<code>year_end_cr</code>	ending year of the current residence	<code>nnnn</code>
Distances to family members:		
<code>d_chn</code>	distance to child $n \in \{1, \dots, 8\}$	<code>km</code>
<code>d_chgvn</code>	distance to child $n \in \{1, \dots, 8\}$ in <code>gv_children</code>	<code>km</code>
<code>d_m, d_f</code>	distance to mother and father	<code>km</code>
Moving:		
<code>move</code>	change of residence since the previous interview	0/1
<code>move_d</code>	change of residence <code>move</code> augmented by information on distances to children and/or parents	0/1
NUTS classification 2003, 2006, 2010, 2013, 2016, and 2021, based on:		
<code>nuts_p</code>	sampling information	<code>zzabc</code>
<code>nuts_b</code>	baseline interview information	<code>zzabc</code>
<code>nuts_i</code>	interview information	<code>zzabc</code>
<code>nuts_h</code>	interview information for last housing spell	<code>zzabc</code>
<code>nuts_lh</code>	life history information	<code>zzabc</code>
<code>nuts_w</code>	<code>nuts_b</code> and <code>nuts_i</code>	<code>zzabc</code>
<code>nuts_ws</code>	<code>nuts_w</code> and <code>nuts_p</code>	<code>zzabc</code>
<code>nuts</code>	<code>nuts_lh</code> , <code>nuts_h</code> and <code>nuts_w</code>	<code>zzabc</code>
<code>nuts_s</code>	<code>nuts</code> and <code>nuts_p</code>	<code>zzabc</code>
<code>nuts_d</code>	<code>nuts</code> and distances to children and/or parents	<code>zzabc</code>
<code>nuts_ds</code>	<code>nuts_d</code> and <code>nuts_p</code>	<code>zzabc</code>
Other variables: Area, Birthplace and Citizenship:		
<code>area</code>	area type of residence	<code>string</code>
<code>r_bp, r_bpc</code>	respondent birth location, coded	0/1, <code>string</code>
<code>r_bpy</code>	respondent birth year	<code>nnnn</code>
<code>r_ct, r_ctc</code>	respondent citizenship in current country, coded	0/1, <code>string</code>
<code>r_ctb</code>	respondent citizenship in current country at birth	0/1
<code>r_cty</code>	respondent year of citizenship	<code>nnnn</code>
<code>r_89</code>	respondent residence in year 1989	<code>n,string</code>
<code>m_bpc, f_bpc</code>	mother and father birth location coded	<code>string</code>

Notes: In values, `z` represents a character, `n` represents a digit. Wave numbers 1-9, character strings `8ca` and `9ca` correspond to a special COVID19 survey in wave 8 and 9, respectively. In NUTS coding, characters `zz` denote level 0 (country code), `a` is level 1, `b` is level 2, and `c` is level 3. `a,b,c` can be a character or a digit. At all levels of NUTS coding, a character `x` represents a missing or non-valid NUTS classification code at that level of NUTS classification. For definitions and details about variables on area, birthplace, and citizenship please see official Release guides. ⁴

2.2 Waves and Interviews

`wave` indicates a wave in which an interview was taken: regular waves 1-9 and two special COVID-19 surveys, `8ca` and `9ca`. A number `wave_lh` $\in \{3, 7\}$ indicates in which wave the life history was collected. Respondents who had their life history questionnaire in wave 3 answered a regular interview in wave 7. The year and month of an interview is `int_year` and `int_month`.

2.3 Years and Residences

All observations are coded for each `year` from the birth year `year_birth` to the year of the last interview `year_l`. The dataset also indicates the year the first observation `year_f`, the year of the baseline interview `year_b`, and the year of the life history interview `year_lh`. In the life history interview, the respondent provided information on individual housing spells `house_lh` with a starting and ending year, `year_start` and `year_end`, respectively. The household respondent provides information on years in the current accommodation in `ho034` and since wave 4 also for the partner in `ho060` that is coded into its starting year, `year_start_cr` (the end-year of this current residence corresponds to the year of interview, `int_year`).

2.4 Distances

In regular wave interviews each respondent also provides information on his or her distance to family members. It is based on three sources of information: first, `d_chn` provide the distance to up to eight children $n \in \{1, \dots, 8\}$ from answers to questions `ch007_n`. Second, very since wave 4, a very similar but not always the same information is `d_chgvn` based on generated variables `ch_proximity_n`. The third source is the distance to mother, `d_m` in `dn030_1`, and father, `d_f` in `dn030_2`. These distances are specified for living in the same building, less than 1km, between 1 and 5km, between 5 and 25km, between 25 and 100km, between 100 and 500km, and more than 500km (or abroad).

2.5 Moving

In the regular interview, the panel household respondent indicated whether he or she changed the residence since the last interview (in questions `ho044` in waves 2-6, `mn104` since wave 7, `ca006` in wave `8ca`). This information is put together in a new variable `move`.

`move_d` contain the information on change in location based on assumptions related to distances to family members, described in Section [3](#).

Information on changes in residences were answered by the household respondent `r_hh` is imputed to all respondents in the same household sharing the same household identification number (`hhid`). Note that a change of residence or moving does not necessarily imply a change in NUTS.

2.6 NUTS classification variables

The resulting NUTS variables are coded as `nuts_p`, `nuts_b`, `nuts_i`, `nuts_h`, `nuts_lh`, `nuts_w`, `nuts_ws`, `nuts_s`, `nuts_d`, `nuts_ds`. All these variables have the same string format, `zzabc`, where the first two characters `zz` denote level 0 (country code), `a` is level 1, `b` is level 2, and `c` is level 3. Each of the last three positions, `a`, `b`, `c`, can be a character or a digit.

At all levels of NUTS coding, a character **x** represents a missing or non-valid NUTS classification code at any classification level. For example, a code **AT3xx** corresponds to NUTS level 1 region Westösterreich in Austria with no information on NUTS levels 2 and 3. Detailed overview of NUTS coding is in Section [3](#).

2.7 Other variables

In addition to housing episodes, several other information is useful for working with geographic data in SHARE. **area** describes the type of municipality of the residence. From wave 5, information on coded geographic location of mother and father’s birthplace is provided in **m_bpc** and **f_bpc**, respectively. If respondent birthplace **r_bp** was not in the current country, it is coded in **r_bpc** and the year the respondent came to the current country is **r_bpy**. Similarly, if respondent’s citizenship is not of the current country, **r_ct**, it is coded in **r_ctc** and the year the respondent obtained the current country’s citizenship is **r_cty**. Finally, for some countries the coded country of residence in 1989 is in **r_89** (East and West Germany). These variables have not been harmonized and are for the user to adapt. For details and definitions, please see official SHARE Release Guides and other methodology publications.

3 geoSHARE Household Episodes Panel NUTS Coding

The first set of NUTS codes consists of original codes from the official data releases and data provided by survey agencies. The second set of created NUTS codes is based on derived information across time or additional information from distances to family members. For each NUTS classification, the NUTS codes provide the following information.

3.1 Original NUTS Codes

1. **nuts_p** is the NUTS code from the sampling procedures in each country that were conducted before the respondent was contacted by a survey agency. For countries with available register, the geographic information is very precise and corresponds to the actual residence of the respondent. For other countries, namely those that sample respondents from random street addresses, the geographic information is less precise. In any case, the respondent might have moved between the sampling and the baseline interview and in such circumstances, the geographic information is not accurate. We use this information because in some countries we miss any other geographic information (especially in the initial waves). This information was obtained from the SHARE Central database in 2023.
2. **nuts_b** is the NUTS code from the baseline interview when the respondent first joined the SHARE project. This code was originally available up to SHARE public data release 7.1.0.
3. **nuts_i** is the NUTS code from the regular interview. This information was obtained from all survey agencies in 2023. For most countries, the information is incomplete. Survey agencies changed over time, some survey agencies deleted old files. Many agencies have only information up to a certain NUTS level. Detailed information on data we were able to recover from survey agencies is in CITE.
4. **nuts_h** is the NUTS code assigned to each year of the current residence from **year_start_cr** to **year_end_cr**. If these spells overlap, the one with a more precise geographic information is used.
5. **nuts_lh** is the NUTS code for each housing spell **house_i** in the life-history interview between a starting year **year_start** and ending year **year_end**. These spells were the

main subject of the housing module. The life history data also contain information on the residence that is not in the HEP dataset.

3.2 Created NUTS Codes

The following NUTS codes are built as a time history based on the SHARE geographic information from the year of birth to the last interview of each respondent. At each step, the original NUTS code is updated only if the new code has more precise geographic information than the original code. For example, if a housing location in a given year is reported in the life history interview as CZ03x but the information obtained from `nuts_h` is CZ031, the latter is used.

1. `nuts_w` combines information from `nuts_b` and `nuts_i`. A more precise `nuts_w` code is filled from the previous wave if `move=0`. Similarly, a more precise `nuts_w` code is filled to the current wave from the next wave if the next wave information on moving is `move=0`. This procedure is repeated for several rounds until no geographic information can be updated.
2. `nuts_ws` also uses information in `nuts_p` if the latter is more precise than information in `nuts_w` at the time of the baseline interview.
3. `nuts` which combines all information in `nuts_w`, `nuts_h`, and `nuts_lh`. The residence is assumed to be remain the same in the following interview the household has not moved, that is `move=0`. Otherwise, the residence stays in the country of interview but without NUTS 1-3 level (for example, ESxxx).
4. `nuts_s` also uses information in `nuts_p` if the latter is more precise than information in `nuts_w` at the time of the baseline interview.

The last two NUTS time series also use additional information on geographic locations obtained from data on distances to children and parents in variable `move_d`. For distance to children we consider up to eight children reported by each respondent in regular wave interviews (questions `ch007`) or from the generated variables module in waves 2-8 (questions `ch_proximity`). For distance to parents we consider the distance to all living parents at the same time (questions `dn030`).

5. `nuts_d` augments `nuts` code by assuming that the residence of the household has not changed, `move_d=0`, since the previous interview if the distance to children and/or parents stays within of *at least one* of the following rules:
 - a) if distance to any three children remains the same;
 - b) if distance to the majority of at least two children remains the same;
 - c) if distance to the only single child remains the same;
 - d) if the number of changes in distances above 25km does not increase for the majority of at least two children.

Similarly, for both living parents between two completed interviews, the residence has not changed if *at least one* of these rules is satisfied:

- e. if the distance to both parents remains the same;
 - f. if the distance to both parents remains below 100km.
6. `nuts_ds` follows the same `move_d` rules but augments `nuts_s`.

4 Interpretation of the Dataset and Examples

Based on our experience from coding the geographic data, users of the geoSHARE HEP are advised to use the geographic data with the following generalizations in mind:

1. Without additional information, `nuts_p` codes provide insufficient information on respondent locations.
2. Without linkage to wave and distance data, `nuts_lh` cannot fully reconstruct the life history geographic information.
3. An analysis focusing on time periods starting from respondents' regular interviews might use geographic data contained in `nuts_w` or `nuts_ws`. This is especially true for research using a more detailed data like postal codes, GPS locations, municipality names, or other information obtained from survey agencies and interviews starting from wave 9. This very detailed geographic information will be part of a future SHARE geographic database potentially with some degree of access restrictions. Please consult methodological publications and our coding of these variables described in Bohacek et al. (2024).
4. The compiled information in `nuts` and `nuts_d` is the best choice for research on life history and household episodes panel analysis.
5. The compiled information in `nuts_s` and `nuts_ds` adds a degree of imprecision but on the other hand provides valuable information be used in countries where the regular geographic information is missing or was inadequately coded in the life history interview. These are the important cases of DE, ES, FR, and GR.

Table 2 shows an example of the Household Episodes Panel for a respondent in Germany born in 1933 with five household spells in the life history interview in wave 3. The sampling, baseline and life history provide information only at level NUTS 1. We have no geographic information from waves 2 to 7. However, in wave 8 we have a NUTS 3 location from the regular interview `nuts_i=DEA29`. In wave 7, the respondent identified the current location as his or her residence since `year_start_i=1946`. Because the respondent moved in wave 7 and 8, we cannot use the above for reconstructing `nuts` or `nuts_s`. However, using the information on distance to family members in wave 8, we can extrapolate `nuts_d=DEA29` and `nuts_ds=DEA29` back to 1946.

Example in Table 3 uses information from sampling in wave 5 to reconstruct `nuts_s` and `nuts_ds`. Three current housing spells and distance to family members help to extend the information from 2020 back to 2009. Life history shows several different NUTS 1 locations. Note that without sampling and distance information, `nuts` locations can be reconstructed only to 2016. Sampling information cannot be extended to years 2014-2015 because of `move=1` in wave 6.

Finally, example in Table 4 shows that using sampling information might imply different NUTS codes in the same years. In the baseline wave 5, the sampling information is more precise than `nuts` because we can reconstruct the latter only for years 2020-2022 from the last current housing spell. Combining two current housing spells and distances provide information at NUTS 3 levels back to year 2000. Note that the life history `year_end=2014` together with the current housing spell extends the NUTS code `DEA27` to that year.

Table 2: geoSHARE: Housing Episodes Panel Example 1

	mergeid	house_i	wave	Timing					Original NUTS Coding				Created NUTS Coding							Moving			
				int_year	year	year_start	year_end	year_start_i	year_end_i	nuts_lh	nuts_p	nuts_b	nuts_i	nuts_w	nuts_ws	nuts_h	nuts	nuts_d	nuts_s	nuts_ds	move	move_d

5 geoSHARE Household Episodes Panel Datasets

Because of the large size of the dataset, the SHARE Household Episodes Panel data for each official NUTS territorial unit classification are stored in a separate `csv` file. For each $c \in \{2003, 2006, 2010, 2013, 2016, 2021\}$, the file

`geoshare-hep-nuts- $c$ .csv`

contains the SHARE Household Episodes Panel data for the respective official NUTS territorial classification for all countries. For example, the data for the NUTS 2021 classification are in a `geoshare-hep-nuts-2021.csv` file.

Due to its large size, we also provide a separate file for each country and NUTS classification. That is, data for a country-specific SHARE Household Episodes Panel for a country $s \in \{AT, BE, BG, CH, CY, CZ, DE, DK, EE, ES, FI, FR, GR, HR, HU, IE, IL, IT, LT, LU, LV, MT, NL, PL, PT, RO, SE, SI, SK\}$ in a NUTS classification c are in a file named

`geoshare-hep-nuts- $c$ - $s$ .csv`

. Different research question and availability of external data might require using different NUTS Classification. The availability of Eurostat data from 1970s is most frequently available in the NUTS 2013 classification while the new data is usually coded in the current NUTS classification.

Finally, when loading or reading the datafile, it is important to specify a semicolon as the delimiter. This is because several geographic variables have commas (most often, in the names of geographic regions). In `STATA`, use `delimiter(";")` while importing the file. In `R`, use `sep=";"` in the `fread` or `read` command.

6 Conclusions

In summary, we have successfully constructed the SHARE Housing Episodes Panel data. It is a comprehensive dataset with consistent and validated NUTS identifiers derived from the geographical data across waves 1 to 9 of SHARE. By leveraging information from initial sampling, baseline interviews, regular wave interviews, the two life history questionnaires, the COVID-19 special surveys, and information on changing residence and distances to children and parents, we have consolidated this data into the official NUTS level 0-3 territorial unit classifications for the years 2003, 2006, 2010, 2013, 2016, and 2021. This dataset is designed to integrate seamlessly with other SHARE data, facilitating extensive opportunities for linkage with a variety of external sources such as administrative records, Eurostat databases, and environmental datasets. The creation of this dataset not only enhances the utility of the SHARE data but also provides a valuable resource for researchers seeking to conduct detailed geographical and temporal analyses within Europe.

7 Acknowledgments and Citation

7.1 Acknowledgments

This paper uses data from SHARE Waves 1-9 (DOIs: 10.6103/SHARE.w1.900, 10.6103/SHARE.w2.900, 10.6103/SHARE.w3.900, 10.6103/SHARE.w4.900, 10.6103/SHARE.w5.900, 10.6103/SHARE.w6.900, 10.6103/SHARE.w7.900, 10.6103/SHARE.w8.900, 10.6103/SHARE.w8ca.900, 10.6103/SHARE.w9.900, 10.6103/SHARE.w9ca900) see Börsch-Supan et al. (2013) for methodological details. This work was generously supported by the Ministry of Education, Youth and Sports of the Czech Republic through the project SHARE-CZ+ (CZ.02.1.01/0.0/0.0/16_013/0001740) and through the project SHARE-CZ LM2018138 and SHARE-CZ LM2023070.

We are grateful for the cooperation with the SHARE Berlin Institute, David Jirsa, Stephanie Stuck, Stefan Gruber, Diana Lopez-Falcon, Daniel Schmidutz, Judith Kronschnabel, Madina Japakhova, David Richter, Axel Börsch-Supan, and many other collaborators from SHARE country teams, survey agencies, and other researchers in the SHARE-COVID19 Horizon 2020 project.

7.2 Citation

When using the geoSHARE Housing Episodes Panel data, please use the following citation:

Bohacek, R., Ferrari, I., and Pasini, G. (2024). geoSHARE: Household Episodes Panel. SHARE Working Paper. SHARE Berlin Institute, Berlin.

7.3 Data Access

The geoSHARE Household Episodes Panel dataset can be obtained from SHARE by request. It is our hope that the dataset will eventually become accessible to all users compliant with the GDPR regulation.

Further information on geographic data obtained from survey agencies, including postal codes, GPS locations, area specification, and other more granular information, can be found in

Bohacek, R., Ferrari, I., Jirsa, D., and Pasini, G. (2024). geoSHARE 1.0: Geographic Information in Regular SHARE Waves. SHARE Working Paper. SHARE Berlin Institute, Berlin.

8 Temporary Notes

During coding of the SHARE Housing Episodes Panel we used the following corrections:

1. In life-history data, all references to years in `year`, `year_start`, `year_end` are at least equal to `year_birth`.
2. The current housing spell of the partner (`ho060`) is assigned to the partner by `mergeidp` in the corresponding wave.
3. Missing information on moving in wave `8ca` and `9ca` is interpreted as `move_d=0`.
4. In life history data, a housing spell is considered as valid despite it missing `year_start` if the previous and next known `nuts_lh` are the same. The `nuts_lh` is filled in if the code is missing.
5. Information on proximity in a respondents' social network have not been used in coding the Household Episodes Panel. For some research questions users might want to social network modules `gv_sn` and `gv_networks` with several variables on proximity in a respondents' social network: Proximity of closest social network member (`most_prx`), mean of proximity of social network (`prx_mean`), or number of social network members within five or one kilometer (`prx_5km` or `prx_1km`). These questions were asked only in wave 4 and 6, and because the composition of social network changed over time, it was impossible to use such information in a consistent way over substantial periods of time.

A SHARE Survey Waves

Appendix [A](#) contains summary statistical tables for geographic locations without sampling information, `nuts_w`, `nuts`, and `nuts_d`, and for geographic locations with sampling information, `nuts_ws`, `nuts_s`, and `nuts_ds`.

For each wave 1-9 and for the two special Covid19 surveys, the top table shows counts of respondents with valid geographic information at NUTS level 1-3. The bottom table on each page shows the percentage of respondents with valid geographical information at NUTS level 1, 2, and 3. The total number of respondents corresponds to NUTS level 0. All results are for the NUTS 2021 territorial classification.

B Years in Across SHARE Survey Waves

Appendix [B](#) contains summary statistical tables for geographic locations without sampling information, `nuts_w`, `nuts`, and `nuts_d`, and for geographic locations with sampling information, `nuts_ws`, `nuts_s`, and `nuts_ds`.

For each year between wave 1 and wave 9, that is for all years between 2004 and 2022, the top table shows counts of respondents with valid geographic information at NUTS level 1-3. The bottom table on each page shows the percentage of respondents with valid geographical information at NUTS level 1, 2, and 3. The total number of respondents corresponds to NUTS level 0. All results are for the NUTS 2021 territorial classification.

C All Years in the Household Episodes Panel

Appendix [C](#) contains summary statistical tables for geographic locations without sampling information, `nuts_lh`, `nuts`, and `nuts_d`, and for geographic locations with sampling information, `nuts_s`, and `nuts_ds`.

For each decade of years spanning the lifetime of SHARE respondents, that is for all decades between (1900-1909, 1910-1919, ..., 2010-2019, 2020-2029), the top table shows counts of respondents with valid geographic information at NUTS level 1-3. The bottom table on each page shows the percentage of respondents with valid geographical information at NUTS level 1, 2, and 3. The total number of respondents corresponds to NUTS level 0. All results are for the NUTS 2021 territorial classification.
